DetectX® Cell Signaling or Inflammation Assay Kits

Cell Signaling

The biochemical and molecular events governing signal transduction have emerged as a field of intense study. The highly conserved mechanisms regulating cell signaling precisely orchestrate the activity of almost all cellular processes. Therefore, aberrant cell signaling is implicated in many diseases, such as cancer and neurodegeneration, prompting ever increasing research efforts to better understand cell signaling pathways.

Arbor Assays provides tools to measure the status and activity of important signaling enzymes and effector molecules. Our kinase and cyclic nucleotide assay kits including cGMP are the easiest and most sensitive assays available to help researchers answer important questions about regulation of key cell signaling events.

Inflammation

Inflammation is a complex biological response to harmful stimuli, such as pathogens, damaged cells or irritants. Chronic inflammation has been linked to diseases including cancer, neurodegeneration, heart disease and autoimmune disorders. The molecular mechanisms and biochemical mediators of inflammatory responses have long been the focus of intense scientific study.

Arbor Assays provides unique tools to measure inflammatory response mediators like bioactive lipids and cyclic nucleotides. For example, our prostaglandin E₂ (PGE₂), Endothelin-1 (ET-1), and Atrial Natriuretic Peptide (ANP) assay kits are the most sensitive and easiest to use, setting the standard for measuring these key markers of inflammation.
